An investigation of the impact of the previous gestational age on the blood pressure and other blood-pressure-related indices in the third trimester of pregnancy. To investigate the relationship between the gestational age and blood pressure (BP) and other blood-pressure-related indices in the third trimester of pregnancy. During the period of 1996-2003, 1176 women delivered their babies at the CHS Medical Center of Kaohsiung Medical University in Taiwan. BP and other related parameters were measured during each visit. SPSS was used to analyze the correlation between the gestational age and BP. The mean blood pressure was 94.0/62.0 mmHg at 26-27 weeks, 95.0/63.0 mmHg at 29-30 weeks, 94.0/62.0 mmHg at 31-32 weeks, and 94.0/62.0 mmHg at 33-34 weeks, while systolic and diastolic pressures were significantly higher in the 30-34 week group (P 2d92ce491b)
