PS - Good news: I was able to replace the M2 battery terminal. Axion Production and Its Impact on Compact Stars The non-Abelian properties of gauge interactions of a charged scalar field are of great interest in a broad variety of areas from high energy astroparticle physics to condensed matter physics and can be regarded as among the most challenging phenomena in theoretical physics. In particular, these new phenomena are expected to have a profound impact on the axion-photon system. In the limit of strong gauge couplings, the potential between two charges and a particle is related to the Feynman vertex by a sum over all possible intermediate states. In the case of axions and photons, this results in an effective potential of the form of the Yukawa interaction, where the particle exchange is now replaced by a four-boson vertex, the axion-photon vertex. From the cosmological point of view, the existence of a long range potential between a point-like source and a static charge (like the Sun) can lead to significant modifications of the structure of compact stars. Motivated by this, in this lecture I briefly summarize our work on axion production in compact stars and discuss the corresponding physics.Q: Javascript - How to concatenate multiple variables together for use as a single string? Given a string such as: dynamicValue="&item.subcategory.text;" How can I make it into a string such as: dynamicValue="&item.subcategory.text;&item.subcategory2.text;&item.subcategory3.text;" I'm using jQuery and 2d92ce491b
