Translation Memory Manager (TMM): - Organize the translation memory; - Allows you to create languages packs, edit existing translation memory files and verify and synchronize existing translations; - Supports ASCII, UTF-8 and unicode text; - Encodes selected translations in BCP 47 Standard; - Has an included Persian (Farsi) Dictionary; - Allows to choose between "Fuzzy" or "Specific Match" matching; - Has built-in support to "Languages of the World"; - Contains a built-in version control for all translations in the current project; - Lists all the translations that have been found for a specific string; - Handles all the encoding formats, including binary (BOM) and XML; - Provides the possibility to use plain text messages, to process special Unicode characters (using unicode escape sequences); - Has a very intuitive UI, with full screen support; - Has a Windows Forms or WPF application; - Has .NET 2.0 and 3.5; - Has a UNICODE environment; - Has a very small memory footprint, resulting in faster operation; - Has a background operation with no UI, so it never freezes the UI; - Has a multi-threading background operation for faster work; - Has a built-in localization support for localization databases; - Has a built-in support for localization references, allowing you to use your own reference files; - Has a built-in support to UTF-16, UTF-32, Big Endian and Little Endian files. Resource Translation Toolkit is a simple to use tool especially designed to help its users translate PO, RC, RESX and properties files from one language to another. The application features full Unicode support and enables translation to Asian languages. Resource Translation Toolkit does its task by using a TMX or POT format Translation Memory that contains unique translated strings and generates translated assemblies, catalog files or DLLs. The translation memory provides extensive support for many of the resource files typically used in localization software, including.resx,.properties,.xml,.cs,.cpp,.h,.hx and.tb files. In addition to the translation memory, Resource Translation Toolkit also supports POT files, allowing you to take advantage of the memory's special support for POT files (pot being the acronym for Portable Object Template). In the following, the properties of the

Resource Translation Toolkit is a simple to use tool especially designed to help its users translate PO, RC, RESX and properties files from one language to another. Resource Translation Toolkit does its task by using a TMX or POT format Translation Memory that contains unique translated strings and generates translated assemblies, catalog files or DLLs. Resource Translation Toolkit is a simple to use tool especially designed to help its users translate PO, RC, RESX and properties files from one language to another. The application features full Unicode support and enables translation to Asian languages. Resource Translation Toolkit does its task by using a TMX or POT format Translation Memory that contains unique translated strings and generates translated assemblies, catalog files or DLLs. Resource Translation Toolkit Application includes over 100.000 translated strings in TMX format. With this tool you can create and manage your Translation Memory in any MS SQL server. Among all the other translation software out there, MQL, Microsoft's own language translation engine, is one of the most complete. However, it's not possible to use MQL directly in any other Windows program. The big companies are right to be keeping control of their own programs, and MQL is no exception. Fortunately, there are alternatives, and one of the most thorough is the Microsoft .NET Framework. Microsoft's .NET Framework Language Translator is a standalone utility that runs within Microsoft's .NET Framework, and it can be used in conjunction with other .NET language resources to create translations for programs that use the .NET Framework. It provides a mapping framework between the .NET Framework and other Microsoft products, such as Visual Basic, Visual C++, ASP, XML, JScript and BCS. You can create your own maps for new programs and languages, and you can add all of your existing language maps into the framework automatically. Language Translator is based on Microsoft's own Language Translation Framework, and it exposes a set of open-source classes that provide the mapping between the Microsoft products and languages. This way, you can use Language Translator to create, edit and update language mappings and resources in your .NET Framework applications. How Language Translator works: Language Translator lets you create and maintain your own resources for mapping between languages and Windows programs, or languages and languages. You can create maps for languages and products, or you can create maps for new languages and products automatically. You can add existing language mappings to Language Translator and add new ones, so you can update your resource file with your most used mappings. You can create or update language resources easily. You can save all changes in a document and reuse them again. You can reuse map and strings files that are stored in your hard disk to speed up the process of creating new mappings and new resources. You can maintain your language maps in MS SQL Server. You
